Raghav Tippireddy

Fremont, CA | (510) 745-4958 | rs.tippireddy@gmail.com | linkedin.com/in/raghavtippireddy

EDUCATION

Purdue University West Lafayette, IN
Bachelor of Science in Data Analytics Expected May 2028
Relevant Coursework: Statistics, Probability, Applied Machine Learning, Application in Data Science, Data Visualization, Database Programming, Data Management, Enterprise Data Management, Research Methodology and Design, Calculus

TECHNICAL SKILLS

Languages: Python, SQL, Java
Data and Modeling: Pandas, NumPy, scikit-learn, Linear Regression, Random Forest, demand forecasting, backtesting
Visualization and BI: Tableau, Power BI, Excel, Matplotlib, Seaborn
Tools: Oracle SQL Developer, VS Code, Claude Code

EXPERIENCE

Nekter Juice Bar Fremont, CA
Freelance Data Scientist Dec 2025 – Present

- **Modeled daily demand for 56 ingredients** from 85 days of **POS data** (7,017 orders), **562 supplier invoice lines**, and a **588-row bill of materials** built from recipe cards.
- **Backtested 8 forecasting methods** walk-forward with no data leakage; weekday-adjusted rolling methods cut error per order window from **34.0% (naive baseline) to 17.1%**.
- Diagnosed a spike-chasing failure in the mean-based forecast and replaced it with a **7-day median**, cutting median error from **9.9% to 7.5%** and bias from +3.4% to +1.0% across 88 ingredient-windows.
- **Corrected sampling bias** in POS exports (portion size shown on only a 24% morning-only sample of orders) by reweighting the size mix to match revenue; reproduced revenue per unit across **5,709 orders within 0.9%**.
- Validated modeled usage against supplier invoices with physical plausibility checks, catching a double-count that had **overstated ingredient usage by 13–35%**.

Parstock Fremont, CA
Founder & Engineer May 2026 – Present
Inventory forecasting and reordering software for multi-unit restaurants

- Productized the forecast as a web app that turns POS sales into case-level order quantities per delivery date, at **7.5% median error** on 3–4 day order windows (**walk-forward backtest**, 11 delivery cycles).
- Built **price-change detection** on an outlier-resistant baseline (median of the first three deliveries) that surfaced a **57.9% supplier price increase** worth **$207/month**.
- Designed a **recipe-free fallback** that estimates from purchase history, keeping 95 of 97 items orderable with **zero recipe data** and labeling each estimate by the strength of its evidence.
- Built the **Toast POS data pipeline** ingesting **7,000+ orders** and **94,000+ modifier records**, covered by 218 automated tests including invariants on real POS data.
- Secured a **franchise operator** with **$13.5K/month** in food spend as **design partner**.

ezyHire Inc. (ezyConneqt) San Francisco, CA
Account Executive May 2026 – Present

- Own **full-cycle sales** from prospecting through **live product demo** and close for an **AI prospecting platform** and a **managed lead generation service** on **$2,500–$4,000/month contracts**; closed new business including **Blumetra Solutions**.
- Built a **167-account pipeline** of LA County credit unions and mortgage banks, prioritized with a **tiered title-targeting framework** and **persona-specific call scripts for 5 buyer roles**.

Tiburcio Vasquez Health Center Hayward, CA
IT Volunteer Apr 2024 – May 2025

- **Set up, configured, and deployed** computers and IT equipment across **multiple clinic sites** to keep day-to-day operations running for staff.

PROJECTS

MLB Player Performance and Contract Value Predictor *Python, Pandas, scikit-learn, Matplotlib, Seaborn*
github.com/raghavtippireddy/MLB-Player-Performance-and-Contract-Predictor

- Built a salary prediction model on **Lahman batting and salary data**, pairing each season's stats with the following year's salary so the model predicts future pay.
- Engineered features including **on-base and slugging percentage** and **arbitration and free-agent eligibility**; log-transformed salary to correct heavy right skew.
- Compared **Linear Regression, Decision Tree, Random Forest, and a neural network** (MLPRegressor) on a 20% held-out test set; the neural network performed best at **R^2 0.65** (MSE 0.113).
- Ranked **undervalued and overpaid players** by predicted-to-actual salary ratio, and used **K-Nearest Neighbors** and **PCA** on standardized batting, fielding, and pitching stats to find cheaper, similar replacements.
