Raghav Tippireddy

Fremont, CA | (510) 745-4958 | rs.tippireddy@gmail.com | linkedin.com/in/raghavtippireddy

EDUCATION

Purdue University West Lafayette, IN
Bachelor of Science in Data Analytics Expected May 2028
Relevant Coursework: Object-Oriented Programming (Java), Database Programming, Data Management, Enterprise Data Management, Applied Machine Learning, Probability, Statistics

TECHNICAL SKILLS

Languages: Python, Java, SQL
Backend and APIs: FastAPI, Uvicorn, Jinja2, REST APIs, OAuth2
Databases: SQLite, Oracle SQL
Libraries: Pandas, NumPy, Matplotlib, Seaborn, openpyxl, pypdf, cryptography (Fernet)
Tools: Linux (Ubuntu), VS Code, Claude Code, Oracle SQL Developer

EXPERIENCE

Parstock Fremont, CA
Founder & Engineer May 2026 – Present
Inventory forecasting and reordering software for multi-unit restaurants

- Built a multi-tenant inventory forecasting web application in **Python 3.13** (**FastAPI**, **Jinja2**, **SQLite**; 19K lines, 67 modules, 23-table schema); signed a franchise operator with **$13.5K/month** in food spend as design partner.
- Wrote the **Toast POS REST client** from scratch on urllib: **OAuth2** client-credentials flow with token caching, pre-emptive refresh, retry on early invalidation, backoff on rate limits, and paginated fetching, ingesting **115K+ order, line-item, and modifier rows**.
- Modeled inventory as an **append-only event ledger** (counts, deliveries, usage, waste), deriving on-hand stock by replay instead of a mutable balance so per-item drift is auditable and correctable with a single spot count.
- Refactored single-tenant globals into **per-request tenant resolution** that fails closed on ambiguity, so a new location onboards by inheriting 223 configuration rows from its brand; encrypted POS credentials at rest with **Fernet** behind read-only API scopes.
- Wrote **218 automated tests**, including cross-tenant isolation and invariant-based tests on real POS data; isolated the forecasting engine in a **subprocess** on a pinned interpreter so dependency changes cannot alter forecast output.
- Built invoice price-change detection that caught a **57.9% supplier cost increase** ($207/month) the operator had missed.

Nekter Juice Bar Fremont, CA
Freelance Data Engineer Dec 2025 – Present

- Built a **6,050-line ETL and forecasting pipeline** in Python (31 modules, standard library plus Excel/PDF readers) on an **8-table SQLite schema** with a location key on every sales and invoice table, making later multi-location support additive rather than a migration.
- Wrote a **recursive modifier-tree expander** over 94,376 nested POS modifier rows to count drinks sold inside bundles; reconciled usage against supplier invoices to catch a quantity double-count that had **overstated ingredient usage by 13–35%**.
- Built a **walk-forward backtest harness** comparing 8 forecasting methods with strict leakage prevention (each prediction for day D uses only prior data); switching to a 7-day median cut **median error from 9.9% to 7.5%**.
- Made supplier invoice ingestion **idempotent**, with a guard against overwriting priced rows and an audit log per run; stored raw API responses so parser bugs replay without re-calling the API.

ezyHire Inc. (ezyConneqt) Fremont, CA
Account Executive May 2026 – Present

- Own full-cycle sales from prospecting through live product demo and close for an AI prospecting platform and a managed lead generation service on **$2,500–$4,000/month** contracts.

PROJECTS

MLB Player Performance and Contract Value Predictor *Python, Pandas, Requests, Matplotlib, Seaborn*

- Built a Python tool that pulls player statistics and salary data from **public APIs** (MLB Stats, Spotrac) to predict future performance and flag over- and under-valued contracts.
- Trained **regression models** (Linear Regression, Random Forest) to predict performance metrics and visualized player value comparisons with Matplotlib and Seaborn.
